

AI-Powered Mobile Data Exchange and Donation System

Abstract:

ABSTRACT

Millions of mobile users lose unused data every month when their data plans expire, while many others face internet shortages for education, job applications, and daily activities. This results in digital resource wastage and unequal access to connectivity.

DataShare AI is an AI-powered mobile data redistribution platform that enables users to donate, exchange, or earn rewards for their unused mobile data. The system uses machine learning techniques to predict data consumption, identify potential unused data, and recommend suitable actions before data expires. A smart matching engine connects users with excess data to those in need, while a reward system encourages participation through points and coupons.

The platform also includes fraud detection mechanisms to prevent misuse and a multilingual assistant to improve accessibility for users from different linguistic backgrounds. By transforming unused mobile data into a valuable shared resource, DataShare AI helps reduce digital waste, promotes digital inclusion, and supports students, job seekers, and underserved communities.

Keywords: Artificial Intelligence, Machine Learning, Mobile Data Sharing, Data Prediction, Smart Matching, Digital Inclusion.
